# Early Notice and Public Review of a Proposed Activity in a Federal Flood Risk Management Standard Designated Floodplain or nearby Wetland

To: All interested Agencies, Groups, and Individuals

This is to give notice that HUD under 24 CFR Part 50 has determined that the following proposed action under Resilient Communities Infrastructure Program (RCIP) Project Number 55LDRC7708 is located in the Federal Flood Risk Management Standard (FFRMS) floodplain and nearby wetlands, and Terrebonne Parish Consolidated Government (TPCG) will be identifying and evaluating practicable alternatives to locating the action within the floodplain and nearby wetland and the potential impacts on the floodplain and nearby wetland from the proposed action, as required by Executive Order 11988, as amended by Executive Order 13690, in accordance with HUD regulations at 24 CFR 55.20 in Subpart C Procedures for Making Determinations on Floodplain Management and Protection of Wetlands. The Weather Stations proposed project locations are at 13 fire stations across Terrebonne Parish as indicated in Attachment A. The extent of the FFRMS floodplain was determined using FEMA FIRMette maps, which show that several sites are located within Zone AE and others within shaded Zone X (Exhibit 1). Wetland proximity was assessed using NWI mapping; while no stations are sited directly in wetlands, several are near bayous across the street. Each weather station will be mounted approximately 10 feet high on existing antennas or easements with no ground disturbance. Based on current information, no effects to the floodplain or nearby wetlands are expected.

There are three primary purposes for this notice. First, people who may be affected by activities in **floodplains and nearby wetlands** and those who have an interest in the protection of the natural environment should be given an opportunity to express their concerns and provide information about these areas. Commenters are encouraged to offer alternative sites outside of the **floodplain and nearby wetland**, alternative methods to serve the same project purpose, and methods to minimize and mitigate project impacts on the **floodplain and nearby wetland**. Second, an adequate public notice program can be an important public educational tool. The dissemination of information and request for public comment about **floodplains and nearby wetlands** can facilitate and enhance Federal efforts to reduce the risks and impacts associated with the occupancy and modification of these special areas. Third, as a matter of fairness, when the Federal government determines it will participate in actions taking place in **floodplains and nearby wetlands**, it must inform those who may be put at greater or continued risk.

Written comments must be received by **TPCG** at the following address on or before **August 6**, **2025**: **terrebonneenvironmental@csrsinc.com**. A full description of the project may be reviewed below.

## **Problem Definition**

#### Instructions:

- All required fields are marked with an \*.
- Given you have the proper permissions, use the SAVE button to save information and calculate data on each page.
- Save at least every 30 minutes to avoid losing data.

Please fill out the sections below or provide attachments with requested information.

### Provide a comprehensive description of the problem this project will address. Including, but not limited to:

- What are the expected results?
- · Is this a new/existing problem?
- · What was the previous use of the site?
- · Does the problem affect a historic area?

Terrebonne Parish, located in Louisiana's coastal region, has faced increasingly dangerous and frequent hurricanes. Terrebonne Parish is geographically one of the largest parishes in Louisiana with over 100,000 residents according to 2023 estimates, many bodies of water and waterways, and acres of coastal wetlands. The landscape makes Terrebonne Parish highly susceptible to flooding. This vulnerability is increased by the Parish's proximity to the Gulf of Mexico, where hurricanes, tropical storms, and other severe weather events have become more frequent and intense. Hurricane Ida brought intense rainfall and flooding that was exacerbated by dangerous winds the caused a loss of power for more than three weeks in many parts of the parish.

Flooding is always a concern in Terrebonne Parish, and flooding does not only come from major storm events. A rain event can bring localized flooding to certain areas of the parish with little forewarning. Currently, National Oceanic and Atmospheric Administration (NOAA) has eleven (11) weather stations as part of the National Weather Service (NWS) in Louisiana, but none are located within the boundaries of Terrebonne Parish. The closest is in Morgan City, about 35 miles away in St. Mary Parish. The accuracy of weather stations diminishes the further a site is from that station.

The Terrebonne Parish Wide Weather Stations project will provide technology for localized weather stations that create more accurate data points for the Terrebonne Parish Office of Homeland Security and Emergency Preparedness (TOHSEP). The real-time accurate data will allow Terrebonne Parish Consolidated Government (TPCG) to serve and protect the community by improving preparation and response time for potential storms.

The RCIP CDBG-DR funded project involves the installation of thirteen (13) new weather stations in the parish at existing fire stations or other publicly owned properties at selected strategic locations. These weather stations individually have a radius of three miles. By installing 13 weather stations strategically throughout Terrebonne Parish, it will result in significantly improving the parish's ability to interpret weather patterns and communicate in real time with the public, particularly LMI households who often feel the greatest impact and benefit from more time to make possible evacuation decisions.

The weather stations will evaluate the following measurements:

- 10 Minute Wind Gust
- Anemometer
- Barometer
- Barometer Tendency
- Dew Point
- Heat Index
- Hygrometer
- Rain Guage
- Rain Rate
- · Solar Radiation
- UV Radiation
- Thermometer
- Wet Bulb Globe Temperature
- Wind Chill
- · Wind Vane

Terrebonne Parish has experienced significant flood events that affect personal household safety and cause widespread damage to homes, businesses, and infrastructure. Accurate and timely information is the greatest resource in hazardous weather events, allowing parish officials to disseminate information quickly and make informed decisions to mitigate risk and possible harm to residents. Having the data points as accurate as possible will increase community resilience in future storms. These weather stations will be crucial in guiding TPCG officials in making appropriate safety announcements throughout a storm event. In addition, the information collected by these stations will be accessible to the public through social media.

This project will not affect an historic area.
